

Telia Infotainment

Onboard passenger information system

Enhance your passenger experience with traffic information, news and entertainment delivered via onboard screens on your bus or train.

Better passenger experience and information

With infotainment on buses and trains, you can effectively communicate digitally with your passengers onboard. Through digital screens, passengers can see the vehicle's current location and the next stop. They can also receive information about current connections and disruptions.

Entertainment and advertising

By adding positioning information data, you can adapt what is shown on the screen based on geographic location and driving direction. And create a new revenue stream with targeted advertising. Examples of entertainment include weather information, video clips, clocks, ads and TV-news.

We will find the best solution for you

No matter what you wish to display and no matter the source, we can help you thanks to our open platform that integrates third-party systems. If needed Telialo can provide the content management system (CMS) enabling you to plan, design and manage the content on your screen.

Key benefits

- Reliable, durable, high image quality
- Maintenance-free
